

# User Roles & Permissions

How elevated permissions work for districts and schools (enterprise model)

Everyone in Tribe Tracker is fundamentally a **user**. Some users are simply granted **more permissions** — the ability to create challenges for a group and to see how their group is doing. There is no "admin" label shown anywhere in the app; these are real-world roles like **District Wellness Manager** and **Building Manager**. Behind the scenes, those users are flagged with a role that unlocks extra capabilities, scoped to the part of the organization they're responsible for.

## 1 The hierarchy

Below the platform owner there are **two elevated roles** — one scoped to a whole district, one scoped to a single school/building — and then everyday staff who take part.

**Platform Owner** — you / Tribe Tracker

Sets up districts, manages billing & the overall app. Not a customer-facing role.

**District Wellness Manager** **Elevated role 1**

Scope: the entire district (all of its schools)

Sees who's using the app across the district and creates **district-wide challenges**.

**Building Manager** **Elevated role 2**

Scope: one school / building — typically a teacher or site wellness lead

Creates **building challenges** for that school's staff and sees their building's activity.

**Staff / Participants**

Scope: themselves

Join challenges, check in on habits, appear on leaderboards, chat.

Organizationally, a building lives inside a district, so a District Manager's view naturally includes the buildings beneath them. The two roles are "children" of the platform owner in the sense that the owner grants and oversees them.

## 2 Who can do what

| CAPABILITY                                    | PLATFORM OWNER | DISTRICT MANAGER | BUILDING MANAGER | STAFF |
|-----------------------------------------------|----------------|------------------|------------------|-------|
| Set up districts & buildings, manage billing  | ✓              | —                | —                | —     |
| See app usage across the whole district       | ✓              | ✓                | —                | —     |
| Create district-wide challenges               | ✓              | ✓                | —                | —     |
| See activity within a single building         | ✓              | district         | ✓                | —     |
| Create building (school-level) challenges     | ✓              | optional         | ✓                | —     |
| Manage staff / membership in their scope      | ✓              | district         | building         | —     |
| Edit / end a challenge they created           | ✓              | ✓                | ✓                | —     |
| Join challenges, check in, leaderboards, chat | ✓              | ✓                | ✓                | ✓     |

district / building = allowed, but only within that person's own slice of the organization.

## 3 The key idea: challenges have an owner level

Permissions hang off **scope**. A challenge is created at a level, and that level decides who sees it.

### DISTRICT CHALLENGE

#### Created by the District Wellness Manager

- Visible to staff at **every school** in the district
- Good for district-wide initiatives (e.g. a step challenge for all employees)
- Rolls up into district usage reporting

### BUILDING CHALLENGE

#### Created by a Building Manager (teacher)

- Visible only to staff at **that one school**
- Good for site-specific goals (e.g. one school's hydration challenge)
- Stays contained to that building

## 4 Example

---

**District Wellness Manager** creates a *"District Step Challenge — January."* Every staff member, at all 12 schools, can see and join it. She opens her dashboard and sees that 340 of 600 employees have signed up.

**Teacher at Lincoln Elementary** creates a *"Lincoln Staff Hydration Challenge."* Only Lincoln staff see it. The district manager can also see it (it's in her district); a teacher at a different school cannot.

**A staff member** opens the app, sees both challenges they're eligible for, joins, and checks in each day — exactly like any other Tribe Tracker user.

## 5 How this maps to data

---

The app already has the scaffolding for this — `districts` and `buildings` tables and District / Building / Staff management screens. The model below builds on that.

- **User** gains a `role` ( `staff` · `building_manager` · `district_manager` ) plus a `district_id` and, for building managers, a `building_id` . That pairing is what scopes their powers.
- **Challenge** gains an `owner_level` ( `district` or `building` ) and the matching `district_id` / `building_id` . Visibility is "show me challenges for my building, plus district challenges for my district."
- **Permission checks** are simple: can this user create at this level, and is the target within their district/building? No new "admin account" type is needed — it's a flag on the normal user.

## 6 Notes

---

- **No "admin" in the UI.** Internally it's a role flag; to users it reads as "District Wellness Manager" or "Building Manager" (or whatever official titles the district uses).
- **Monetization fit.** This is a natural B2B unit: sell per district (or per seat), with the district manager as the buyer/owner of their organization's space.
- **Extensible.** The same scope pattern supports future levels (e.g. region above district) without rethinking the model.
